

Monsieur Bézier 1.0 — quick guide

SketchUp 2024 / 2025 / 2026 extension: a Bézier pen — smooth and corner nodes, just like in vector editors

1 Installation

SketchUp → **Window** → **Extension Manager** → **Install Extension** → pick `monsieur_bezier-1.0-eng.rbz` → restart SketchUp. You get the “Monsieur Bézier” toolbar (one button) and the **Extensions** → **Monsieur Bézier** menu. If the toolbar is gone — **View** → **Toolbars** → **Monsieur Bézier**.

2 Drawing a curve

The toolbar button or **Extensions** → **Monsieur Bézier** → **Bézier curve**.

click	corner node without handles
click and drag	smooth node — you pull a handle, the other one mirrors it
click the first node	close the curve (at least three nodes)
Enter or double-click	finish
Esc	step back — remove the last node
number + Enter	segments per span (1 to 200, default 12) — in the “Segments” box, bottom right

Step back is Esc, not Backspace. Backspace and Enter belong to the input box: while a number is typed there, Enter applies the number instead of finishing the curve.

3 What you get

- Every span between two nodes is a **separate curve**: a single click selects one span, so you can edit or delete it on its own.
- A **triple click** selects the whole chain — like any connected edges in SketchUp.
- A span between two corner nodes is a single straight edge, with no extra points.
- Spans share their end vertices, so for **Follow Me** the chain is one continuous path.
- The whole curve is one operation: undoes it at once.

Node 2 is smooth (mirrored handles), nodes 3 and 4 are corners, so span 3 is straight. Each color is a separate curve.
